A: For the Linux/Mac/Windows: Download "MikTex" (for Linux/Mac) or (TekPub for Windows) (Free) Open the above program. Open the file that has .prj extension. Click File->Print to file. Then, a pop-up window will appear, provide the file name as you wish. Click Save. This file will be saved to "~/Desktop" as you requested. Since March last year, a number of Israelis have been engaged in a novel experiment in particle physics. For days on end, they have been investigating the sun, a means of tracking just how bizarre it can get. What they have discovered is extraordinary, and deeply unsettling. The sun, which seemingly exists in a state of eternal discord and disagreement, is characterized by eruptions of super-hot gas at the sun's surface. As a result, huge gouts of solar material are regularly ejected into space, in the form of gigantic clouds of plasma known as coronal mass ejections (CMEs). Scientists have long known that CMEs are a normal and regular occurrence, which causes transient periods of radio-wave disturbance in the sun's environment – every 12 minutes, on average. However, within the last couple of years, scientists have recorded a dramatic increase in the frequency of these eruptions. This, it seems, is a sign that something is wrong, and that the sun itself is flaring up with more ferocity than ever before. A similar sharp increase in eruptions was noticed in the distant past. On 11 occasions in the decade or so of 1 BCE, researchers noticed increased solar activity, and on five of those occasions, they recorded these huge eruptions that now seem to be such a regular occurrence. The researchers behind the new study, published today in the journal Nature, attribute this increase in activity to what they describe as 'magnetic storm time', a period when the north and south magnetic poles are changing. The new study has mapped the date and frequency of these magnetic storms in the past, and the data they have gathered thus suggests that activity on the sun is much higher than expected. "We saw increased activity in the past, as we are seeing now," says Carl Koen, one of the authors of the new study. "We know that these events are common, but never on this

. A: Don't look for your application to be installed to C:\Program Files or C:\Program Files (x86). I'm talking about the QuickDesigner installs. Normally, when you install one of these apps they are installed to C:\ProgramData or something similar. Next, if you were to run a new "Run" from QuickDesigner, the "Run" command may or may not be listed in the opened application menu (can be seen in the bottom left corner of the program). If you can see "Run" in the menu, it's a good thing. If you're able to see both "Run" and "Designer" then you are in the right spot. It should be under one of these two. Finally, using the more basic method to find your app: Open the command prompt and type in "QD3". If you get the message "It's not installed, but you can try to install the application". if you get a list of applications, your application is listed. Tag: resha The arboretum of UT Austin is not normally on the list of sights to see or the must do during SXSW. It's just a quirky, homey city green space that has become a center of expo, music, and free film festivals. But, unlike other parks within the city, this one is tucked away. The gate is locked and the visitors aren't greeted with a traditional welcome. But, once you're in, you'll find some of the most beautiful plants and trees in Texas. It's also home to an industrial slag pile. Spring has arrived with a vengeance, and Mother Nature is destroying Texas! While swimming holes are dry as bones, the Santa Ana winds are blowing high over the San Gabriel mountains bringing torrential downpours, smoke from wildfires, high humidity, and lightning storms. Firefighters are frantically trying to contain the blaze, but here's where things get really interesting. The arboretum of UT Austin is not normally on the list of sights to see or the must do during SXSW.
